VaySoft Excel to EXE Converter review by Dyogi Sonawane: VaySoft Excel to EXE Converter is a freeware software to convert any Excel file to EXE format.

XLS, XLM, XLTX, XLSX, XLSB and any other Excel

What's New in the?

VaySoft Excel to EXE Converter is a simple and useful piece of software that provides you with a reliable means of

converting XLS, XLM or XLSX files to EXE format effortlessly. What's more, you can even protect your files from illegal usage. Before using the application, you need to make sure that your system meets all the requirements, otherwise you are not able to access the generated EXE file. The Conversion tab enables you to add as many Excel spreadsheets as you want and change the executable output folder. In case you don't want to make further adjustments, you can simply hit the Convert button and view the generated file. However, several options that help you to personalize your files stay at your disposal such as adding logo, inserting a personal watermark or allowing play time limit. By accessing the 'General option' tab you are able to disable the copy / paste function, hide the Excel tool and Formula bars, as well as protect all the available cells. The 'Logo setup' tab

enables you to add a personal logo to the generated file and choose an image that will display after or before playing the Excel spreadsheet. In case you want to personalize your XLS files, you can add customizable watermarks by changing the watermark position size, the background and the font color. What's more, the application allows you to embed special fonts that Excel can not embed. This way, you are able to distribute your files all over the world irrespective of whether other PCs have the font installed or not.

Considering all of the above, VaySoft Excel to EXE Converter proves to be a steady solution when it comes to converting your Excel files to EXE format and protecting them with personal logos and watermarks. Q: Visual Studio VHDL debugger is not responding when program exceeds the debugger's memory I have a

VHDL 2009 simulator with memory limit set to 1 GB. My design has a testbench with two processes. Only one process has the signal txvalid. A connection of this signal is in the verilog. It is on a separate entity. When this signal is 1, the process is executing. When it is 0, a counter is counting for the process. The counter is executing in the design, not in the testbench. If the counter is larger than 1, and the signal txvalid is 1
