Association between genetic polymorphisms of the equilibrative nucleoside transporter gene 1 and susceptibility to multiple sclerosis in the Japanese population. The equilibrative nucleoside transporter gene 1 (ENT1) is a member of the solute carrier family 2, which is involved in the cellular uptake of nucleoside and nucleobases. We performed a genome-wide association study on an association between genetic polymorphisms of the ENT1 gene and multiple sclerosis (MS) in Japanese. In the first phase, we examined the frequency of the ENT1 gene alleles A/A, G/A and G/G in 125 Japanese MS patients and 130 normal controls. A significant difference in the frequency of the ENT1 gene allele G/A was detected between the two groups ($\chi^2=4.95$; $P=0.026$). Subsequently, we further examined the association between the ENT1 gene polymorphism and the clinical phenotypes of MS patients. No significant differences were
