As a rule, Photoshop works best on your PC if you have a fast video card such as a GeForce 8800, which can handle layers. As with any image-editing program, Photoshop includes a toolbox of different features, tools, and layers that can be used. Here's a list of Photoshop features, divided by the type of editing each feature performs: **Raster image editing:** Raster editing can be done through the tools that exist within the layers panel. Raster editing affects individual pixels on the image, which means that it can be used for everything from adding noise to changing the color of a single pixel or text to cropping an image or removing objects from a photograph. Layers help separate these changes into different areas of the image; therefore, you can work on one layer and then apply changes to other layers by using layers. All types of image editing can be performed in a layer, including halftone work, color adjustments, and even creating multilayer images. (This book uses the term `_layers_` when describing Photoshop's editing capabilities; `_layer_` is a term used by other editors, such as Corel Paint Shop Pro.) **Layer masking:** Layer masking is an advanced editing technique that enables you to mask out part of a photo with a `_mask_`. A mask is an object image that represents the area of the layer you want to mask out and is typically done with a paintbrush tool. Layer masks can mask portions of the photo — such as skin tones — and leave other areas of the photo untouched. Layer masks are typically used for more advanced photo editing. **Groups:** A group is a collection of similar elements, such as color channels and/or adjustment layers, that you can configure so that any change to one element affects all the elements in the group. You can edit the colors of a group, and you can use masks to create subtraction images that remove one color from another color in the group. Groups are unique in that you can copy and paste them throughout the edit, changing the order in which they are active. **Adjustment layers:** Adjustment layers enable you to quickly make quick color changes to parts of an image. You can choose to keep a color or a group of colors to a standard color or to change them to the color of your choice. Adjustment layers also enable you to make quick changes to the brightness, contrast, and

Q: Drag overlay out of element but still respond to mouseup I am wondering if there is a simple way to either start dragging a div on mouseup with a touch device or disable the ability to drag the div from another element, while still being able to use the mouseup event to control it when the mouse button is released. I have a little script here that kind of works, but it doesn't allow the user to actually trigger the mouseup event inside the div to trigger the beginning of the drag process. Fiddle: `$(document).mouseup(function (e) { var pos, rect, width; if (document.elementFromPoint) { pos = (event.clientX - e.clientX) / ($(window).width() / 2); rect = $(this).offset().left - $(window).scrollLeft() + $(window).scrollLeft(); width = $(this).outerWidth(); if (pos > 1) { pos = 1; } if (width > rect) { pos = 1 - pos; } $(this).draggable('cancel'); $(this).draggable({ start: function (event, ui) { if ($(this).css('left'`

Project JATO Project JATO (ja:?????????; "Project Jetto") was a Japanese space shuttle program initiated in 1988. Originally a four-stage shuttle, the design was completely redesigned for safety reasons, resulting in a two-stage design, initially named Project Jetto 2. History The Japan Aerospace Exploration Agency began planning a second-generation Japanese space shuttle, called the JX-ST, in 1987. The plan was publicly revealed in January 1989, at the same time that negotiations with the United States for the cooperation on the Space Transportation System (which would become the Space Shuttle) were opening. From June 1989 to May 1990, a technical study group was formed to study the JX-ST. This group consisted of 4 ground organizations (JAXA, AIST, ASC, and NEDO), 10 contractors (HAYASHIDA, KUROSUKE, MACHIDA, MOLA, MITSUBISHI, MITSUBISHI SPACE TOKYO, MITSUBISHI SPACE KOUKAI, MITSUBISHI SPACE SYSTEM, MITSUBISHI SPACE INTERNATIONAL, MITSUBISHI SPACE SYSTEM (THE), and TOYOTA), and 3 universities (TASU, KAGAKU, and HONDA). In August 1989, the JATO was set to use two JX-STs; this was confirmed by the financial Council in October 1989. A basic specification was decided on in April 1990, and the first draft design was completed in May 1990. In June, the project was officially named JATO, and an exploratory study of the use of a hydrogen-oxygen liquid rocket engine was conducted to study low-thrust technology. The first JATO test launch, as part of the Joint US-Japan TKS experiment, was planned for 1995, but was delayed by joint US-Japan congressional funding problems. The final launch was scheduled for 2001, after the proposed joint launch of the Korean KARI-X4 was cancelled, and the cancellation of Soyuz TMA-11. It was also tentatively planned to launch the KEX-16 balloon. The planned launch of the JATO was postponed multiple times. Finally, in July 2005, it was announced that the JATO would be postponed indefinitely due to the lack of financial support. Design The project was
