Just Death is my first open-world crime game concept. It is set in the world of Regulus City, as it was late 1970's/early 1980's San Francisco. The game is my personal endeavor to bring back the darker, edgier fun of 80's style action/action/adventure games. Just Death has two main areas of innovation: 1) The exploration of procedural generation, and 2) the open-city/Open-world dimension. Each new "generation" or "run" of the city will be unique. It is my attempt to create a "dynamic" nature that cannot be done in a traditional adventure game. One of the most exciting features of Just Death is that you will be doing "low-level" criminal activities. You will be "jerking" cars off the street, "pistol blasting" people, or "public lynching" a perp. I have done a lot of research on the subject, and I have the methods and systems to realistically simulate (through physics) low-level criminal activity. Due to the planned procedural nature of the city, I can provide almost unlimited replayability, the look and feel of the game will evolve as I learn more about what type of game I want to make, and take what I learn with me. Other features include: In-game Print, Add, and Delete (self-documenting) stats, Full Steam achievements, Leveling/XP system based on your choices, Randomized loot of game objects. No NPCs, and No experience points. Update December 2014 Just Death is now on Steam Early Access. A: Prey It's an FPS. A: Would S.T.A.L.K.E.R. work? It's an open-world first-person-shooter. It's well-written, it's very polished, and it's free. It could be used as-is. A: Trauma Here's the trailer for Trauma: You play a detective. You work for the CIA or CIA-like organisation. You investigate traumas of any kind, from bomb blast to car crash to gunshot wound. All the in-game graphics are realistic, even though they might look a bit dated (not in a fashionable way). The protagonist

You're a lone survivor from the crash of your ship. It's up to you to explore the hostile world beneath the ice, find your crashed ship and set out for home, all while battling the forces of a relentless nature and dangerous sea life. Travel deep beneath the frozen surface in search of supplies as you fight your way through the land's seven zones. Keep your eyes open and your wits about you for there is danger everywhere! Combat is simple and intuitive. Because there are no "A" or "B" buttons, the only real controls you have are the ship's three HP gauges. When you hit

enemies you'll see HP being drained and a blue bar creeping up the left and right gauges. As that bar fills up, you'll be able to attack and carry out special moves. When your HP reaches zero, you're transported to a safe zone - but you won't be able to carry out any special moves. You have two HP gauges on the top left of the screen. They'll drain down as you move along, but when they're completely gone you're transported to a safe zone.

by the streaming operations over the output burst queue in the buffer. The streaming operations by a typical host or client include reading data by a raster graphics operation SRO (Scan-row-operate) or display list (DL) operation. The output buffer includes a run length conversion (RL conversion) engine which converts the 32-bit aligned runs of image data from 2 bytes of source image data to one 8-bit RGB color pixel component value of each pixel of the output image. While the use of a 32-bit RGB image runs is a useful color representation for applications such as rendering character, graphics, or real-time video from video data streams, it does not provide sufficient precision for many high-level graphics applications, such as computer assisted drawing or recreation of still pictures from video sequences. Indeed, for many graphics applications,

it is desirable for each image element (pixel) to have a 24-bit (RGBA) representation of color information for increased resolution and a higher-level color image. Such a higher-level color image is often referred to as a “true color” image. By including an 8-bit RGB color component value in each pixel of output image data, the image fidelity can be enhanced by the use of color correction operations such as gamma correction, normalization, or scene scene transfer functions. But under the conventional process of splitting scan-lines into a burst that includes extended color information, the color correction operations cannot operate on the color data of a burst directly. The 8-bit RGB component values are too few to define the extent of a pixel or to utilize any color correction operations, such as gamma correction, normalization, or scene-transfer function, without resorting to clamp values for the RGB component values. The present invention is directed to resolving, or at least reducing, one or all of the problems mentioned above. Things are kicking off for Fab's new project with some brand new promotional material. The image below is the first look at one of the names on the label we
